AB - JP2000229233 NOVELTY - A dispersant for inorganic powder consists of a copolymer of a polyalkylene glycol allyl ether and maleic anhydride and/or its hydrolyzed product and has superior hard caking resistance. The copolymer and/or its hydrolyzed product has a weight-average molecular weight of 30,000-150,000.

- DETAILED DESCRIPTION - The alkylene glycol allyl ether of formula (1) is new.

- A = 2-4C alkylene, or alkylene oxide;

- n = addition mol, 30-150;

- R1 = H, or 1-20C organic residue.

- USE - The dispersant is used in the inorganic powder for use in an inorganic pigment, an abrasive, ceramics. The inorganic pigment is used in a coating material, ink. The dispersant is suitably used in slurries for various inorganic powders.

- ADVANTAGE - The dispersant provides the inorganic powder with superior dispersibility, long-term dispersion stability, and hard caking resistance.
